you may use to tie your shoes,
most people may differ but you
get the general idea.

Also that algorithm is an example
of Pseudocode. Pseudocode is a
combination of English and
programming code.

We use pseudocode to plan or
outline or program before we go
in to actually hack out the code.
This makes it a lot simplier and
is suggested for even small projects.

Look at the first pseudocode you
write out as a rough draft. You
want to keep writing new drafts
to refine and break down the steps
until you have a clear and
achieveable algorithm. For example
here's how you could break down
the earlier pseudocode even more
for putting your shoes on.

Still no castling, en passant and promotions, though, although there's an 831 byte version which has those.. Some things that make chess engines non-deterministic: 1) Most chess engines use an opening book instead of calculating moves early in the game.. I did once try to pit it against a modern engine It seemed to do reasonably well until the modern engine sneakily castled, and I was unable to tell 1k Chess about this, thus forcing it to forfeit the game.
